

Junos REST

- GET/POST/DELETE
- Validate-only strategies
- Fixture-backed offline mode

Endpoints

- Base: `/rpc/` or `/rest/` depending on mode
- We use simplified HTTPX client

GET Example

```
resp = client.get(url, headers=h, timeout=5)  
data = resp.json()
```

Validate-Only Pattern

- Dry-run equivalent where supported
- Compare state → act only on diff

Offline Mode

- `OFFLINE=1 python day3_rest_and_json/02_junos_rest_httpx.py`
- Reads `common/fixtures/junos_software_info.json`

Validation

- Log summaries; store JSON
